AI Store Operator Kit

The setup checklist, the three Claude Code prompts and the morning routine from the video "Claude Can Now Run Your Online Store". Everything in the order you need it, ready to copy.

Made by **Bo Sar**, youtube.com/@bo-sar

4
tools and the job each one does

6
setup steps, in the right order

3
prompts, word for word

1
morning routine, ready to paste

READ THIS FIRST

What you are building

A Shopify store where Claude does the operations work. It finds products with sales data behind them, puts them in your store, rewrites the pages for one specific buyer, builds a margin dashboard and sends you a five-line report every morning. When an order comes in, AutoDS buys the product from the supplier and the supplier ships it.

You stay in charge of two things: the decisions, and the one switch that spends money. Everything else in this kit is about setting it up once and then giving Claude clear instructions.

The four tools and the job each one does 3

Setup checklist, in order 4

Check that Claude can see both sides 6

Prompt 1. Find products and add them as drafts 7

Prompt 2. Rewrite a product page for one buyer 8

Prompt 3. The one-page margin dashboard 9

The morning routine 10

Before your first real order 11

Mistakes I made so you don't have to 12

How to use the prompts

Copy them word for word the first time. When they work, change the niche, the buyer and the numbers to fit your store. If copying from this PDF breaks the lines, there is a plain text file with all the prompts on the same page where you downloaded this kit.

Prices, menus and features are as of October 2026. These tools change fast. If a menu looks different on your screen, ask Claude where the setting moved.

THE SYSTEM

Four tools, one job each

Each tool is here for one reason. If you remove one, a part of the store stops working.

THE SUPPLIER SIDE

AutoDS

Finds products that already sell, imports them into your store, buys from the supplier when an order comes in, brings the tracking number back, and watches supplier prices and stock every day.

THE STORE BUILDER

Build Your Store

AutoDS's own builder. You pick a niche, and it builds a Shopify store with a theme, pages, ten products that already sell and a free .store domain in a few minutes.

THE SHOP

Shopify

Where customers see your products and pay. The product pages, prices and discounts live here.

THE OPERATOR

Claude Code desktop

Talks to AutoDS through the AutoDS connector and to Shopify through Shopify's AI Toolkit plugin. It does the work you would otherwise click through by hand.

Why Claude needs two connections

The AutoDS connector is the supplier side: product research, winning products, importing products into your store. It does not edit prices or page text. The Shopify plugin is the shop side: titles, descriptions, SEO fields, discounts and orders. Claude needs both, one for each side of the business.

> The agent proposes, I approve, then it acts.

That is the rule for every prompt in this kit. Each prompt asks Claude to show the plan or the list first and wait for your go. And the one switch that spends money, fulfilment and the balance, you turn on by hand.

SETUP CHECKLIST, PART 1

Do it in this order

AutoDS account first, because the store builder works off that account. The connections last, because each connection needs the accounts on both sides to exist already.

1 ☐ **Open your AutoDS account**

Start the 3-day trial for $1 here: **autods.com/rz47**. Answer the onboarding questions (new store, Shopify). The trial turns into a paid plan after 3 days, so put a reminder in your calendar.

---

2 ☐ **Build the store with Build Your Store**

Go to **buildyourstore.ai/37p7**, click Build my free store and pick a niche. The free store is enough to start. It asks you to create a Shopify account, and the only bill in this step is Shopify's own plan.

Wait until it says the store is ready. Then in the Shopify admin, open **Online Store, Preferences**, remove the password and save. Write down your store address that ends in **.myshopify.com** (Settings, Domains). You need it in step 5.

---

3 ☐ **Connect the store to AutoDS**

In AutoDS: **Add Store, Shopify Store, I have a Shopify store**. Shopify asks you to approve the AutoDS app. Approve, and you land back in AutoDS. Open **Products**: the ten products from your store should be listed there.

Set your store currency before you connect

Decide which currency your store sells in before step 3. If you change it later, AutoDS keeps the old currency until you renew the token and resync the store inside AutoDS. I lost half an hour on this.

SETUP CHECKLIST, PART 2

Give Claude the keys

4 ☐ Add the AutoDS connector to Claude

In the Claude desktop app open **Customize, Connectors**, search **AutoDS**, click the plus and log into your AutoDS account. Connectors you add in Claude show up inside Claude Code desktop too.

Make an empty folder for the store (I called mine `autods-store`), open the **Code** tab, start a new session and pick that folder.

If Claude can't see AutoDS: type `/status`. If it says you are on an API key, type `/login` and log in with your claude.ai account. Backup option, run this in Terminal, then type `/mcp` in Claude Code and log into AutoDS from there:

```
claude mcp add --transport http autods https://mcp.autods.com/mcp --scope user
```

---

5 ☐ Add Shopify's AI Toolkit plugin

The easy way: paste this into Claude Code, with your real store address, and Claude installs everything. A Shopify window opens, you check what it asks for and approve.

SETUP REQUEST — PASTE INTO CLAUDE CODE

```
Install Shopify's AI Toolkit plugin for Claude Code with "claude plugin
install shopify-ai-toolkit@claude-plugins-official", install the Shopify CLI,
and turn off the toolkit's telemetry. Then log me into my store
YOURSTORE.myshopify.com with these scopes: read_products, write_products,
read_orders, read_discounts, write_discounts.
```

By hand instead, in Terminal, one at a time:

```
claude plugin install shopify-ai-toolkit@claude-plugins-official
npm install -g @shopify/cli@latest
shopify store auth --store YOURSTORE.myshopify.com --scopes read_products,write_prod
ucts,read_orders,read_discounts,write_discounts
```

Then start a new Claude Code session in the same folder, so the plugin loads.

---

6 ☐ Turn on fulfilment, by hand, last

This is the switch that spends money, so you do it yourself. Full steps on page 11.

BEFORE THE REAL WORK

Check that Claude can see both sides

Two quick questions before you give Claude any real job. If one of them fails, fix it now. Every prompt after this depends on both connections working.

Check 1. The AutoDS side

CHECK 1 — PASTE INTO CLAUDE CODE

```
What AutoDS tools do you have? List my AutoDS stores.
```

WHAT SHOULD HAPPEN

Claude lists its AutoDS tools (product search, winning products, product details, importing to your store and a few more) and shows your store by name. If it says it can't see AutoDS, go back to step 4.

Check 2. The Shopify side

CHECK 2 — PASTE INTO CLAUDE CODE

```
List the products in my Shopify store with their prices.
```

WHAT SHOULD HAPPEN

A list of the ten products Build Your Store put in, with prices. If Claude doesn't know which store to use or can't log in, run the `shopify store auth` command from step 5 again and start a new session.

Give Claude a short brief about your store

Create a file called `CLAUDE.md` in your store folder with three or four lines: the niche, the buyer you have in mind, your store address and "always show me a plan before changing anything in Shopify". Claude reads it at the start of every session, so you don't repeat yourself in every prompt.

PROMPT 1

Find products and add them as drafts

Three rules: the product already sells, it gets to a US customer in under ten days, and it leaves at least sixty percent margin. The best three go into the store as drafts, so nothing is live until you say go. Change "pet store" to your niche.

PROMPT 1 WORD FOR WORD

```
Use AutoDS to find products for my pet store. I want products that already sell, ship
to the US in under 10 days, and keep at least a 60 percent margin at the price you
would charge. Show me the best eight in a table with supplier price, shipping time,
your suggested price and one line on why each one fits. Then upload the top three to
my store as drafts and wait for my go before publishing.
```

WHAT SHOULD HAPPEN

1. Claude calls AutoDS several times. You see each call on the left side.
2. A table comes back: eight products, supplier price, shipping time, suggested price, and why each one fits.
3. Claude asks before it uploads the top three. Say yes. They land in AutoDS as drafts.
4. Look them over. Type **go**, and Claude publishes them. Refresh your store and they are there.

Check before you say go

Drafts often come in with a lot of variants (colours, sizes, bundles). Open each draft and remove the variants you don't want before you publish. Also read the numbers in the table. If a price or margin looks wrong, ask Claude to recheck that row.

In my run, number one was a self-moving bouncing ball for dogs: $8.79 with shipping from a US warehouse, suggested price $22.99, 62 percent margin, and 35 other sellers already importing it.

PROMPT 2

Rewrite a product page for one buyer

Imported products come with supplier text written for nobody in particular. This prompt rewrites one page for one specific buyer and adds a buy-two discount. Put in your product name and your buyer. Start with one product, check the result, then do the rest.

PROMPT 2 — WORD FOR WORD

```
Now open my Shopify store. Rewrite the product page for smart bouncing ball only, for first-time dog owners in their thirties: a clear title, a short description that says what it is, why it helps and how fast it ships, plus an SEO title and meta description. Also add a buy-two bundle discount on this one product. Show me the plan as a table first and change nothing until I say go.
```

WHAT SHOULD HAPPEN

1. Claude reads the product and shows a plan as a table: new title, new description, SEO title, meta description, and a few ways to do the buy-two bundle, each with its margin.
2. Nothing changes until you type **go**. Then the page is rewritten in a few minutes.
3. Open the product on your phone. Add two to the cart and check that the discount shows up.

Shopify has no undo button

Changes in Shopify are live the second they happen. That is why every Shopify prompt ends with "show me the plan first and change nothing until I say go". Keep that line in every prompt you write.

In my run Claude also suggested raising the price by $2, so the buy-two discount still left more than sixty percent margin. Read the plan for changes like that before you say go.

PROMPT 3

The one-page margin dashboard

AutoDS has all the numbers, but you see them one product at a time. This prompt puts the whole store on one page and flags the products that don't leave you enough money.

PROMPT 3 WORD FOR WORD

```
Pull every active and draft product from my AutoDS store and build me a one-page HTML dashboard: product, supplier, buy price, my price, margin and shipping time. Flag anything under 30 percent margin.
```

WHAT SHOULD HAPPEN

Claude pulls the product list from AutoDS, does the math, writes a small web page into your store folder and opens it in your browser. Every product on one page, with anything under thirty percent margin flagged in red.

What to do with the red rows

- Raise the price, if the product still makes sense at the higher price.
- Find the same product from a cheaper supplier. Ask Claude to search AutoDS for it.
- Remove it. A product that sells but leaves no margin is only work.

Expect red rows from the starter products

In my store, most of the ten products the builder put in were under thirty percent. That is normal for products anyone can import, because everyone can import them. The niche, the buyer and the angle are where your margin comes from.

THE MORNING ROUTINE

The part that runs without you

A routine is a prompt Claude runs by itself on a schedule. Write down the check you would otherwise do every morning, and Claude does it for you.

Set it up

1. In the Claude desktop app, **Code** tab, click **Routines** in the sidebar.
2. **New routine**, choose **Local**. Name it `morning-store-report` and pick your store folder.
3. Paste the instructions below. Schedule: **Daily**, the time you want it (mine is 9:00). Save.
4. Click **Run now** once and watch it. When it asks for permission to use AutoDS or Shopify, choose **Always allow**, so the morning runs don't stop and wait for you.

ROUTINE INSTRUCTIONS — WORD FOR WORD

```
Every morning: check yesterday's orders in Shopify, refresh the AutoDS dashboard, flag
any product whose margin dropped under 30 percent, and suggest one new pet product
from AutoDS's winning products. Keep it to five lines.
```

WHAT SHOULD HAPPEN

Every morning Claude starts a fresh session, runs through the list and sends you a notification. The report shows up under Scheduled in the sidebar: yesterday's orders, the margin check and one new product idea. If a supplier raised a price overnight, you know before your coffee.

It runs on your computer

A Local routine runs only while the Claude app is open and the computer is awake. If the computer slept through the scheduled time, it runs once when it wakes up.

THE ONE SWITCH CLAUDE NEVER TOUCHES

Before your first real order

This is where money moves, so a person turns it on. Claude has no access to it, and that is on purpose. After this, orders run by themselves.

1 ☐ **Turn on Fulfilled by AutoDS**

In AutoDS, open your store **Settings, Orders**. For each supplier, turn on **Process orders using Fulfilled by AutoDS** and **Automatic orders**.

2 ☐ **Load the balance**

AutoDS pays the supplier from your balance. On the Orders page, load enough for your first orders. Check that price and stock monitoring are on, so your prices and stock follow the supplier every day.

3 ☐ **Place one test order**

Buy one cheap product from your own store. If card payments aren't set up yet on a brand-new store, create the order in the Shopify admin (**Orders, Create order**, add a customer with a real shipping address, **Mark as paid**). AutoDS treats it like a real one.

4 ☐ **Watch AutoDS Orders**

The order shows up in AutoDS by itself, AutoDS buys it from the supplier with your balance, and the tracking number comes back to the order a few days later. You don't need to click anything in Shopify for this. AutoDS picks up the order on its own.

Check the shipping countries first

Before the test, open the product in AutoDS and check which countries it ships to. The test order must go to an address the supplier delivers to.

SAVE YOURSELF AN AFTERNOON

Mistakes I made so you don't have to

WHAT HAPPENED	WHAT TO DO
AutoDS showed the old currency after I changed it in Shopify	Pick the currency before you connect. If you change it later, renew the token and resync the store in AutoDS.
Claude couldn't see the Shopify plugin	The plugin loads when a session starts. Start a new session after you install it.
Claude couldn't see AutoDS	The connector works with your claude.ai login. `/status` shows how you are logged in, `/login` fixes it.
Drafts came in with many variants	Trim the variants in each draft before you say go.
Asked the AutoDS connector to change a price or a description	It can't. Prices, page text and discounts go through the Shopify side, as in Prompt 2.
A Shopify change went live before I checked it	End every Shopify prompt with "show me the plan first and change nothing until I say go".
The morning report didn't arrive	The computer was asleep or the app was closed. It runs once when the computer wakes up.

What this setup does not do

It does not find a single customer. Traffic, the brand and the reason someone buys from your store instead of every other store selling the same product are still your job. Now they are the whole job.

One more thing. People ask AI assistants what to buy more and more, and the assistant reads your product pages. Pages written clearly for one buyer, like the ones from Prompt 2, work for that reader too.

WHAT NEXT

The same idea works in any business

An online store is the easy version. The products, the supplier and the orders all live in tools that already talk to each other. In most companies the operations work is spread over email, spreadsheets and people's heads, and that is where an AI operator saves the most time.
